

Anne Crijns

'As a radiation oncologist, I am closely involved in the patient's treatment process. I specialize in the treatment of patients with breast cancer and hematological malignancies. An important aspect of my work is providing patients with information about radiotherapy-induced side-effects in the short and long term. Prevention of late side-effects (with focus on radiation-induced cardiac damage) are also an important goal of my scientific research. Conducting scientific research is necessary to improve the care of future patients, but also of patients who have already been treated.'
