Digital Twins for Energy Automation

The answer to many problems

How to validate my protection settings?

How to train my team more efficiently?

How to reduce my FAT/SAT time on site?

How to interact fast with experts?

How to manage longer delivery times with material shortage?

With virtual copies of the products and systems, individually or interfaced as an ecosystem

Digital Twins for Energy Automation

The power of ecosystems and the role of interfaces

“The whole is more than the sum of its parts” - Aristotle

Testing Digital Twin

Digital Twins for Energy Automation Across the Lifecycle

Digital Twin for Planning

Challenges for Protection Engineers in Utilities

With a 7x DER growth in the next 10 years power flows and short circuit levels change

Is my protection system still secure, dependable and selective?

How about using Digital Twins?!

...

How can I ensure correct relay operation during volatile power flows?

How does power electronics affect my protection relays?

Does the relays fulfill our performance requirements?

Was the relay behavior correct in the field during the last event?

Is my protection system compliant with regulations and standards?

Digital Twin

Definition and Structure

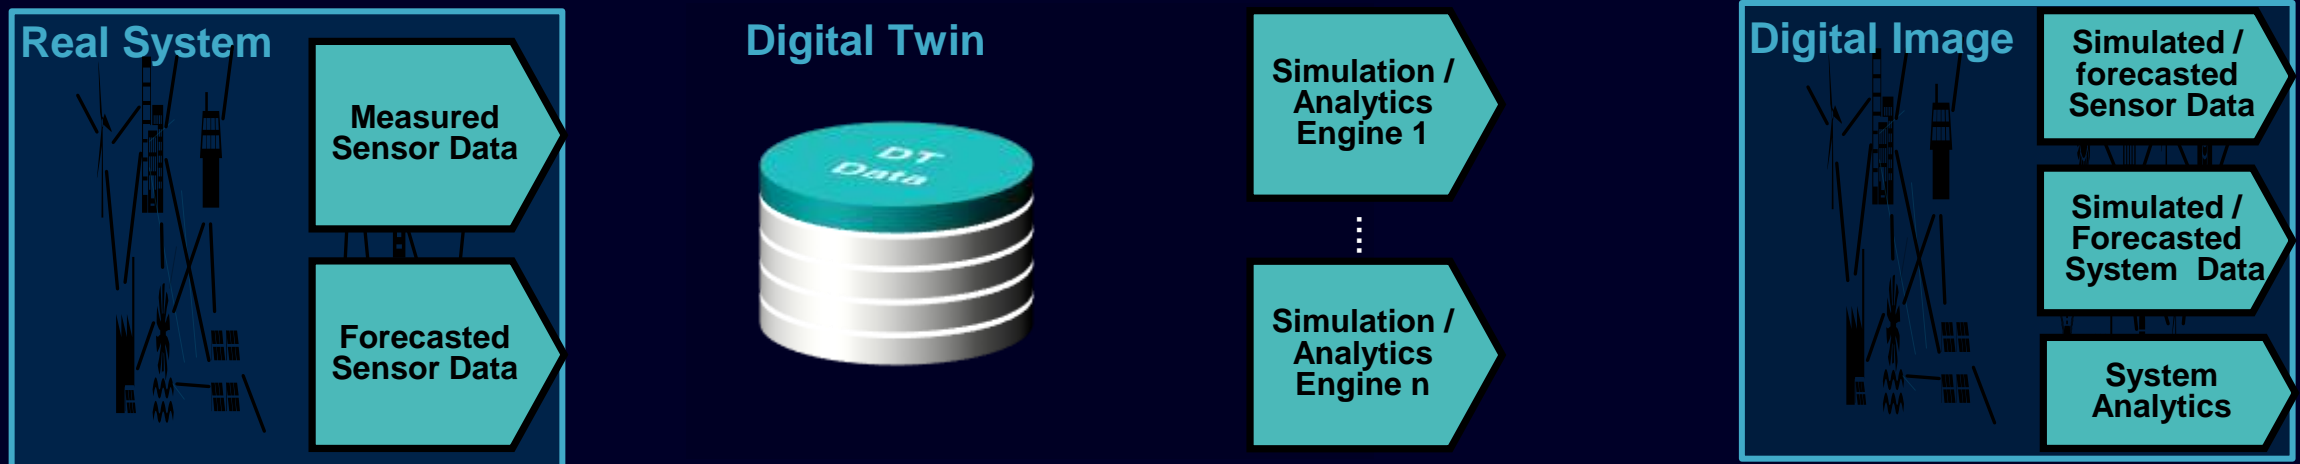

A **Digital Twin (DT)** is a virtual representation of an asset, a system or a system of systems.

It can be used in design, simulation, monitoring, optimization and servicing.

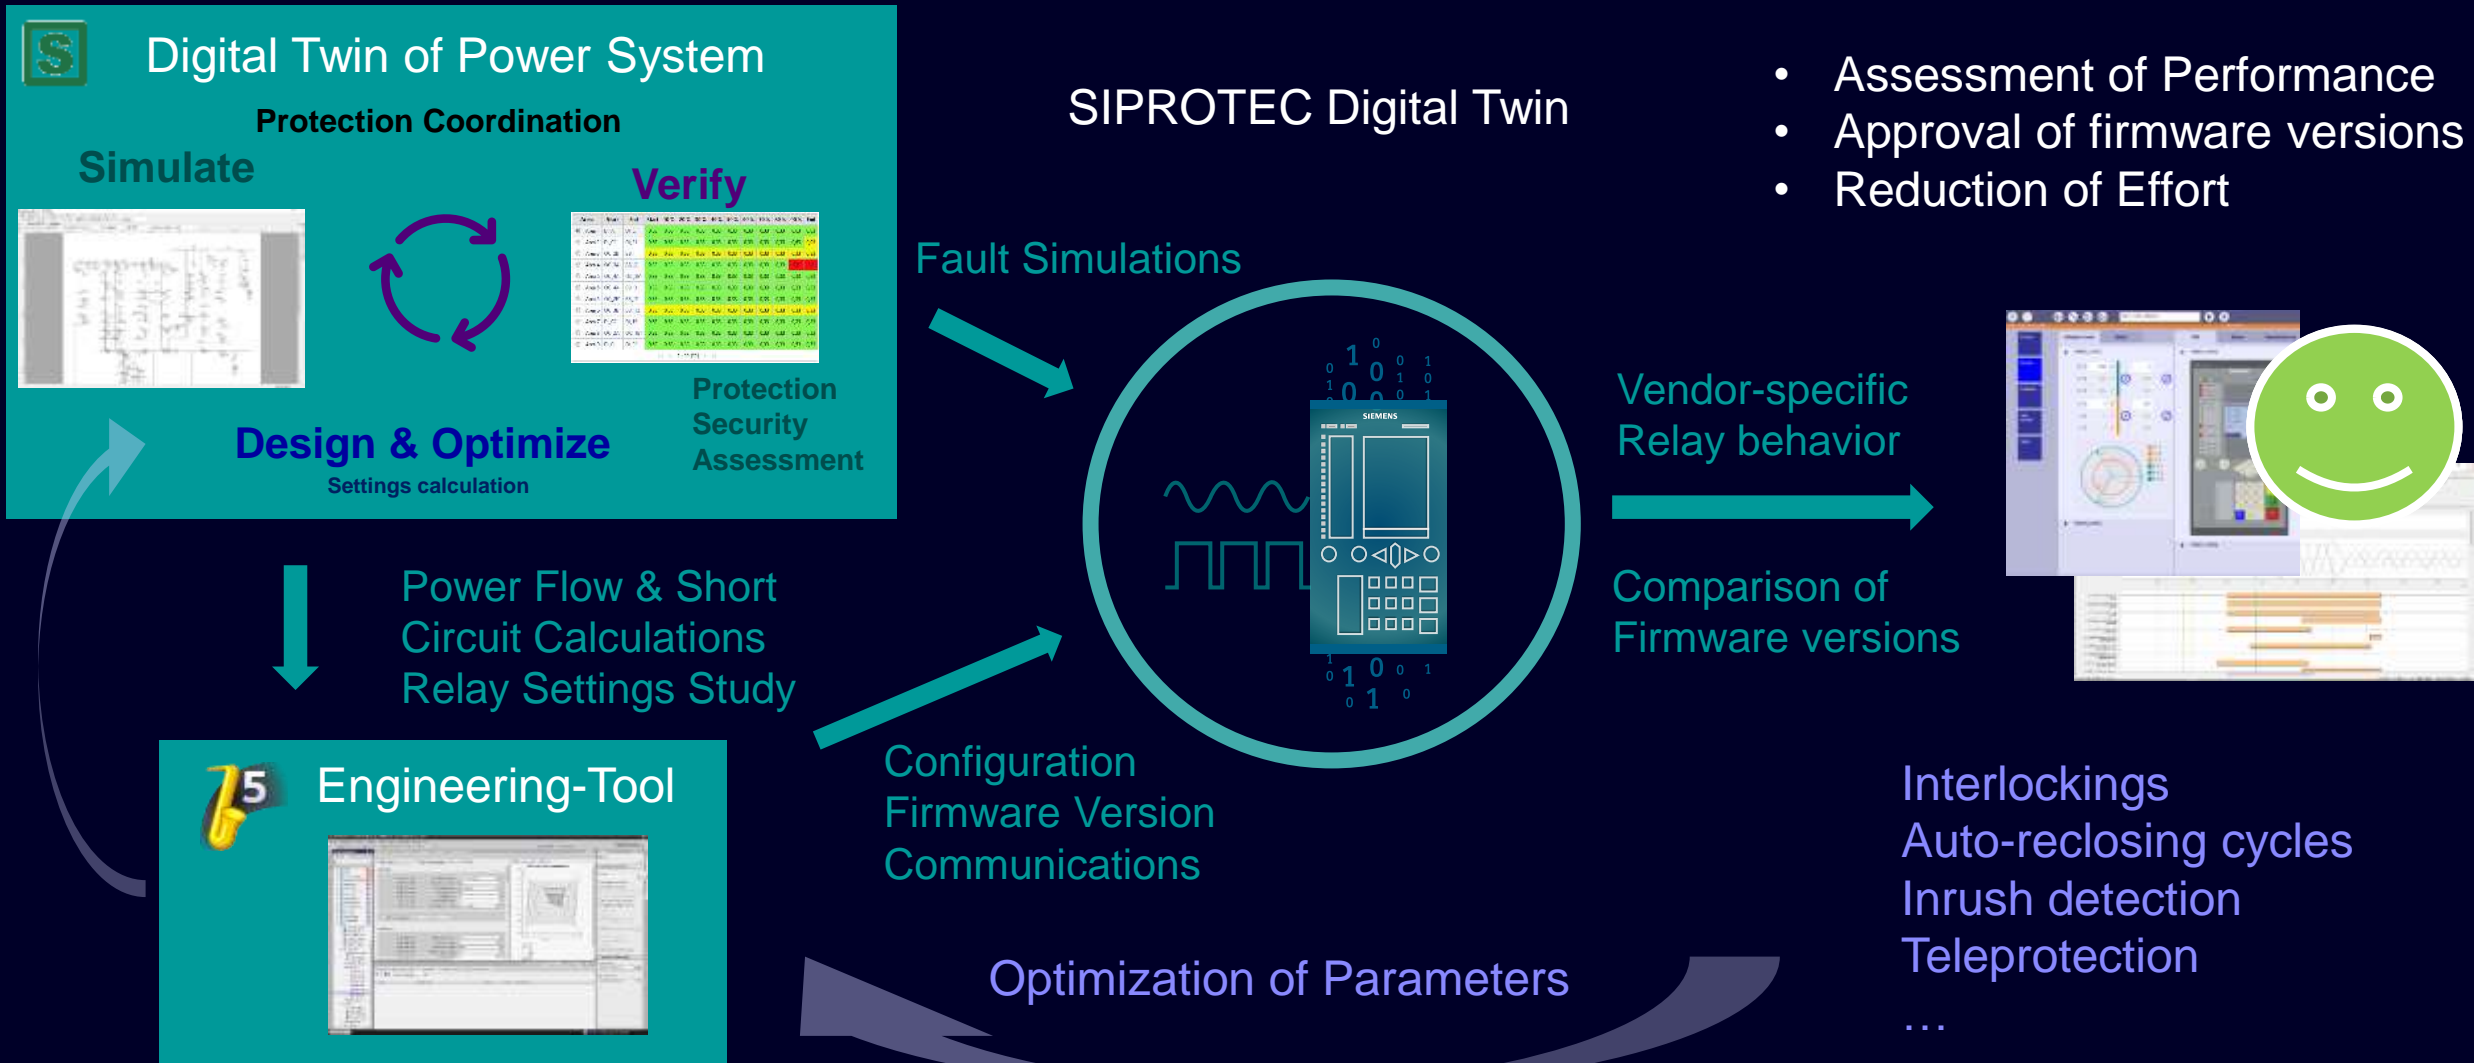

The DT must be described in general as a:

DT of (what) and for (what purpose). E.g. DT of an IED to assess Relay Behavior

The DT consists of data, describing the real product or system in an appropriate manner for the target purpose, combined with the appropriate simulation / analytics engine. It can provide inputs for sensors, connected to the real assets and / or can simulate the outputs of sensors.

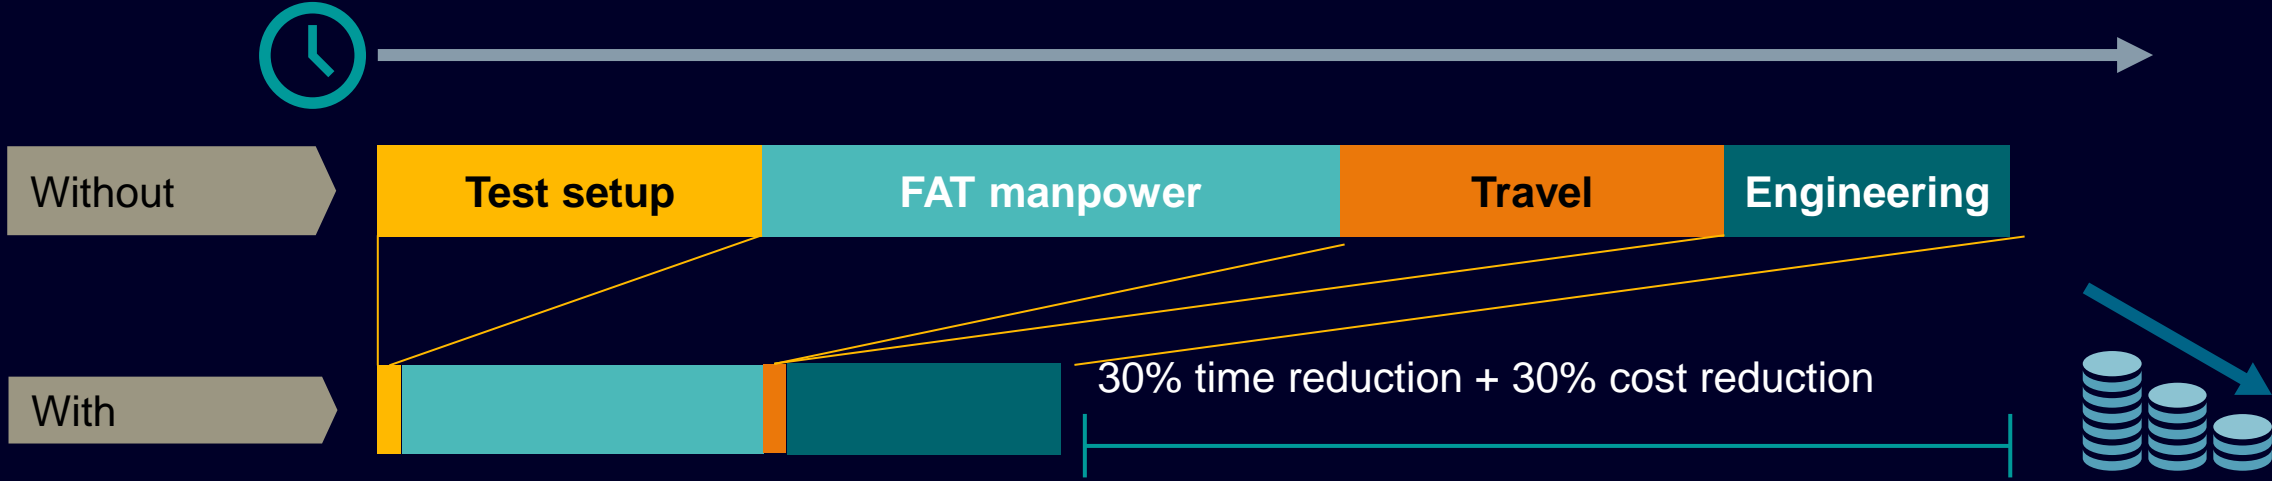

Digital Twin Approach for the Assessment of Protection Systems

Digital Twin for virtual FAT

Digital Twins for virtual commissioning

Save your time and costs for Factory Acceptance Test (FAT)

Virtual FAT

Disruptive without physical test setup

- No logistics of protection devices,
- No waiting for panel production,
- No temporary installation and wirings,
- No additional test hardware

- Virtual devices,
- Virtual wirings

Virtual FAT

Access within minutes to your protection system

1

Open DIGSI 5 project

2

Export SIM file

3

Connection to the Cloud

4

Import SIM

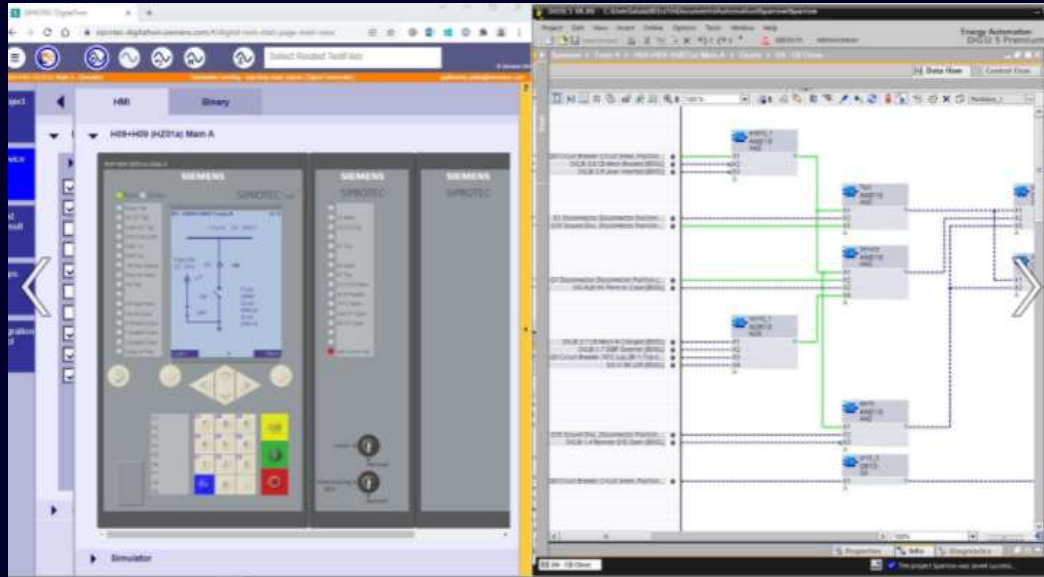

5

SIPROTEC DigitalTwin

Virtual FAT

Same functional scope but more benefits

- Same functional test scope
 - Front display, 
 - Programmable logic
 - GOOSE communication (interlockings, trips,..)
 - Protection schemes (51, 59, 21, 25, 87, 87B, 90V ...) with static or transient input values
- Several people can work.
 - In parallel on same or different devices
 - Without travel, 
 - Safe from home / office

Virtual FAT

Including Ethernet interfaces to other components anywhere

Jaime Andrés Morales Rincón • 1st
Systems Specialist at Siemens Energy and Automation
1yr • Edited •

Today, I finished testing a breaker and a half configuration for an electrical substation from the comfort of my home. Thanks to a Siemens Digital Twin, I was able to simulate all the protection relays of my substation with IEC61850 such as 6MD85 (bay controller), 7SL87 (line differential and distance protection), 7VK87 (circuit breaker management device) and 7SS85 (busbar protection). I used a little communications switch that we use to access the Internet at home, a Sicam A8000 as a gateway (controller substations) connected to an IHM (Wincc) and to an IEC 60870-5-104 simulator (remote control center), both applications they run on my laptop. The tests were as follows: interlocks, protection signals, binary input / output signals, measurements and Goose between protection relays. I have a complete substation testing lab at home thanks to a Siemens Digital Twin.

- Interface to real hardwares via VPN:
 - RTU for DCS signal tests, e.g. via IEC 61850 MMS
 - Local HMI
 - GOOSE with available IEDs or simulated via SCL

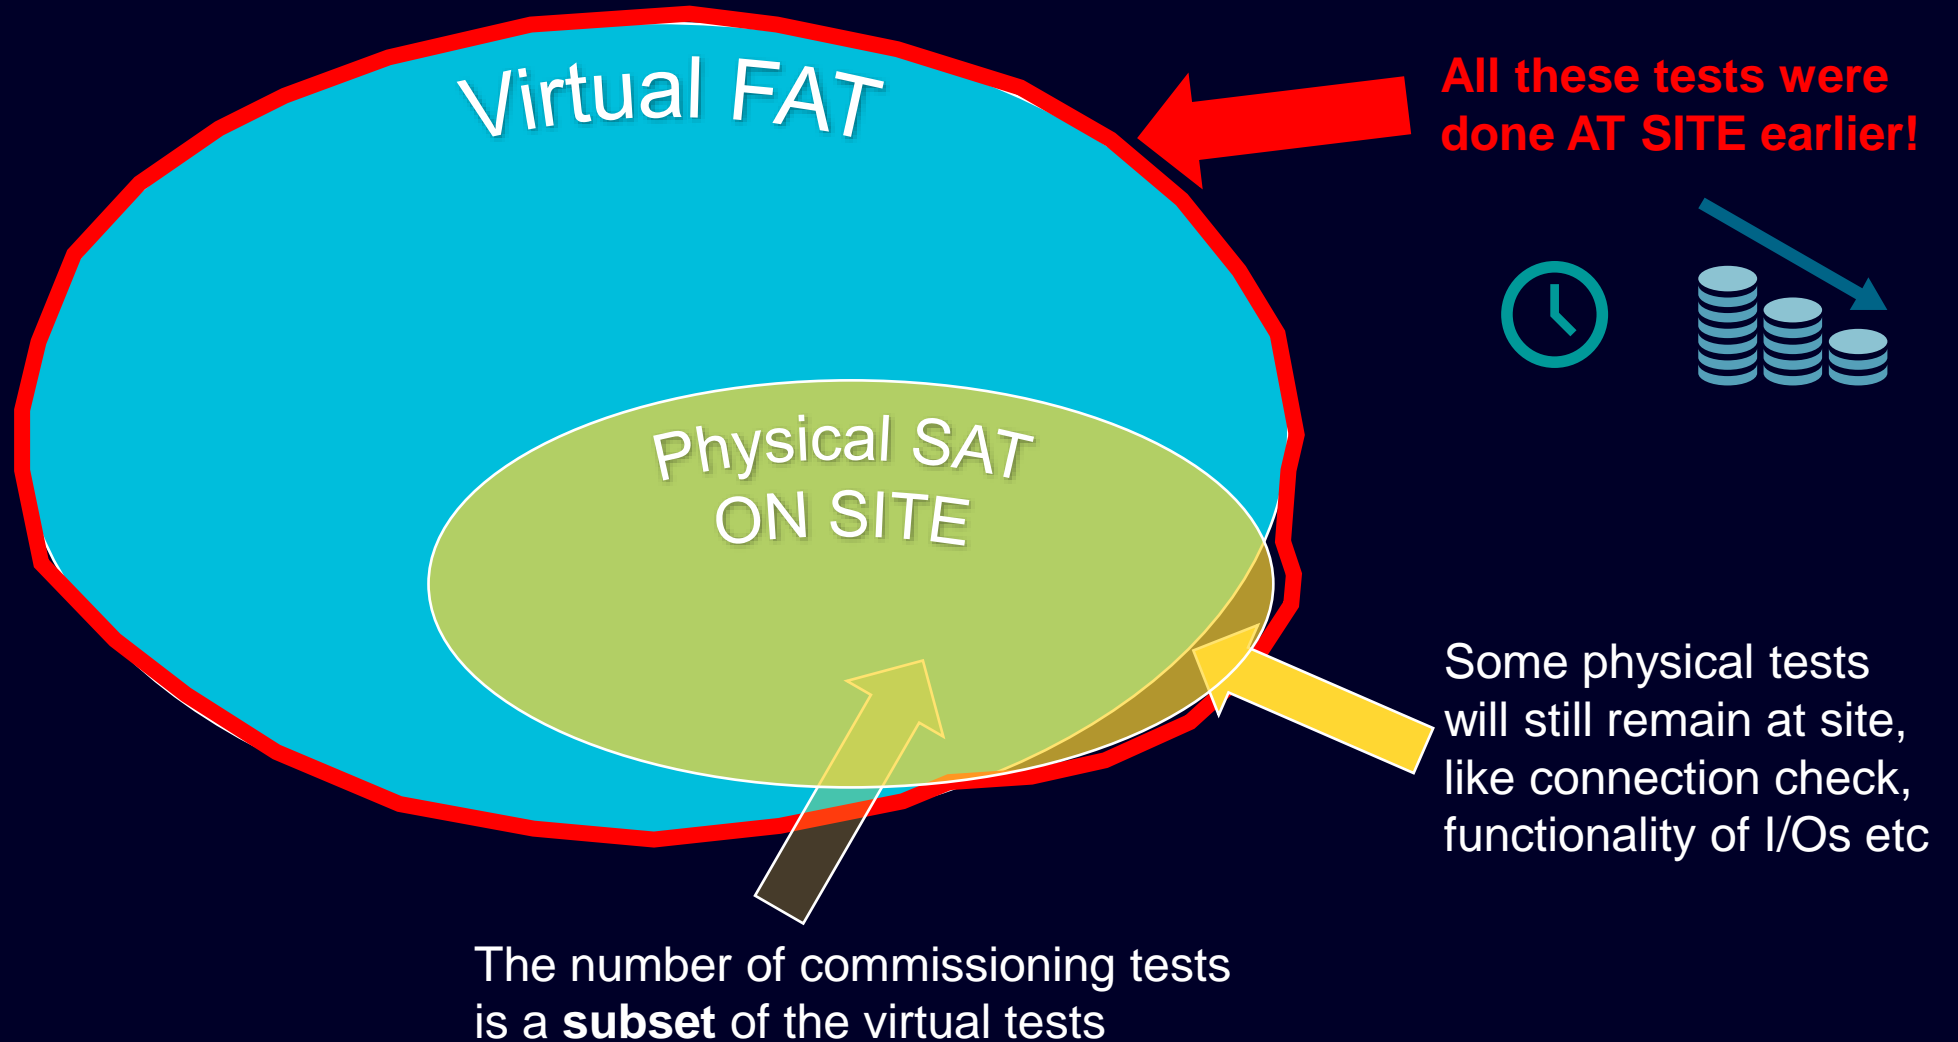

- Possible to temporary share the access to any substation system provider

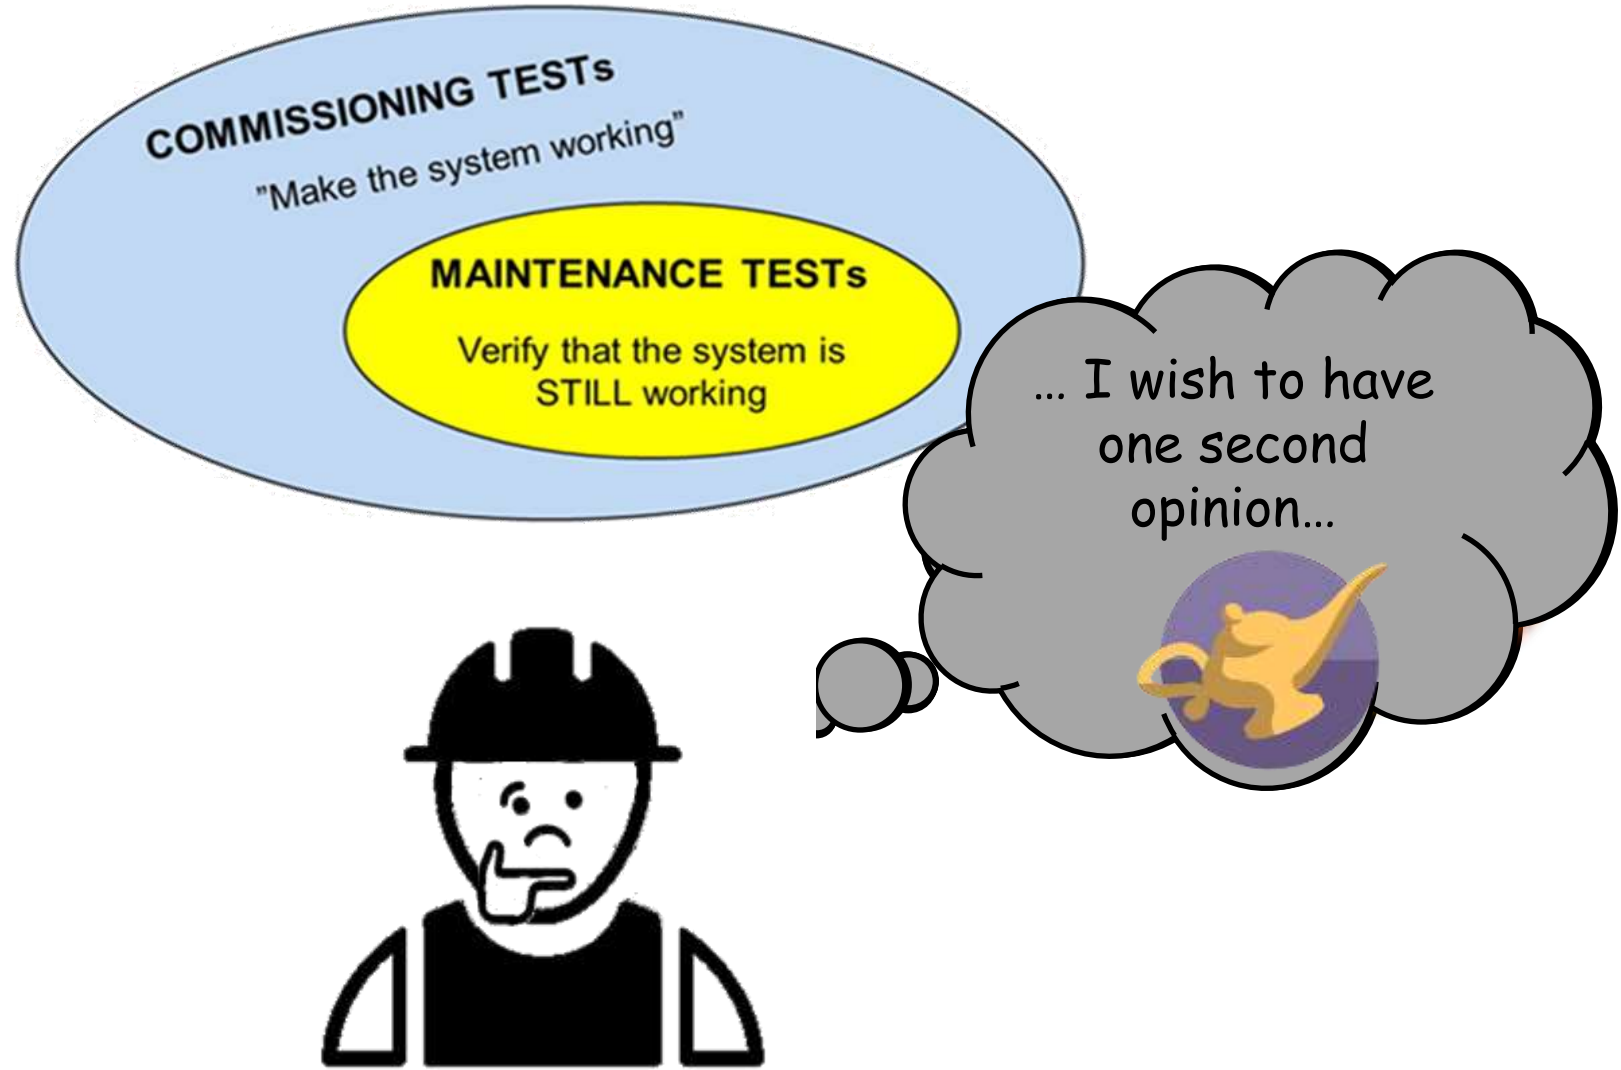

Virtual commissioning

Best preparation for Site Acceptance Test

Digital Twin for Commissioning

The commissioning activities have a strong responsibility

The specialist travels to the site

- Very expensive
- Specialists are very busy!

GETTING A SPECIALIST HELP TODAY

To help, the specialist needs to be able to analyse the situation as if he/she "was there"

This is an investigation process, where the expert must really be able to filter out any possible noise or biased information, no matter if given in good or bad faith.

Help by mails, video calls

- Many mails
- Misunderstandings...
- What time is it there?

Use of hardware relay clones

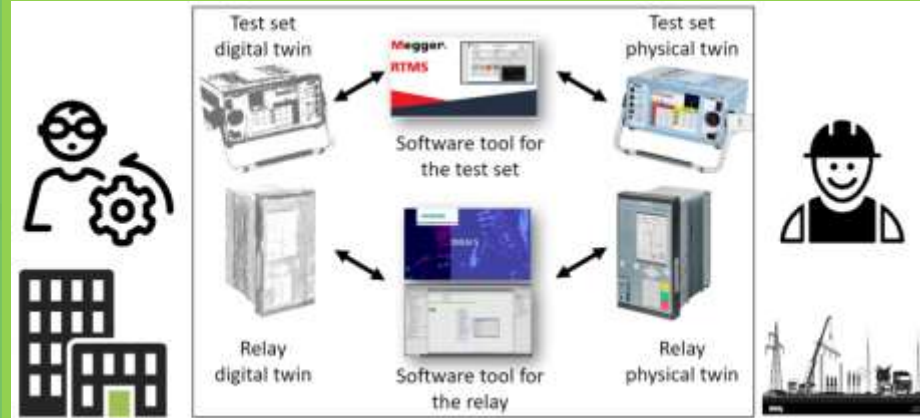

- Needs many HW equipment (relay manufacturer?)

The specialist work from home or office

- No travel cost
- Time of specialists is used more efficiently

GETTING A SPECIALIST HELP WITH DT technology

Only few important mail messages

- No misunderstanding. Just “SAME DATA”
- Work in your time zone! ☀️

Use of software clones (digital twins)

- Fast support
- Accessible to any relay specialist

Digital Twin for Training

Train your team

The key for a safe and secure operation

Virtual benefits are real:

- Practice setup for each trainee
- No software installation required
- Safe operation with your own devices
- Simulation of currents and voltages
- Possible remotely, and outside training hours

- Learn about protection relays and full digital substations with IEC 61850
- For any role from planner to engineer, operator or maintenance

Trainings

Easy Practice with modern IEC 61850 possibilities

The image displays several overlapping screenshots from Siemens IEC 61850 software. The top-left window shows network configurations for a 'Competitor' and a 'SIP5 Staging Device', including IP addresses and device types. The middle window shows a project tree and a 'Functions Structure' table with columns for 'Name' and 'State'. The bottom-left window shows a log of 'IEC61850 Sampled Values' with details for an ASDU, including its ID, count, and a list of phase measurements with their quality and validity.

- IEC 61850 Ed1/Ed2/Ed2.1 compatibility
- IEC 61850 Flexible product naming – same datamodel and GOOSE messages
- IEC 61850 SMV flexible streams
- IEC 61850 test modes
- IEC 61850 simulation bit

This block contains two screenshots. The left one shows a configuration window for a 'simulation bit' with a 'switch' button. The right one shows a monitoring interface with a graph and data tables, likely representing the real-time status of the simulation bit.

University partners

Technologies to attract the next generation of power engineers

- Increase the attractiveness of our niche market
- Increase practical experiences during studies
- Reduce training-on-the-job

- Where can Digital Twins provide value:
 - Professor for lectures
 - PhD students for industry research
 - Students for lab practices

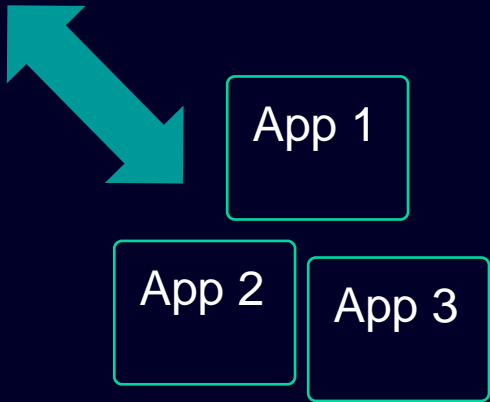

Digital Twin for the future

From manual interactions and assessments to open API

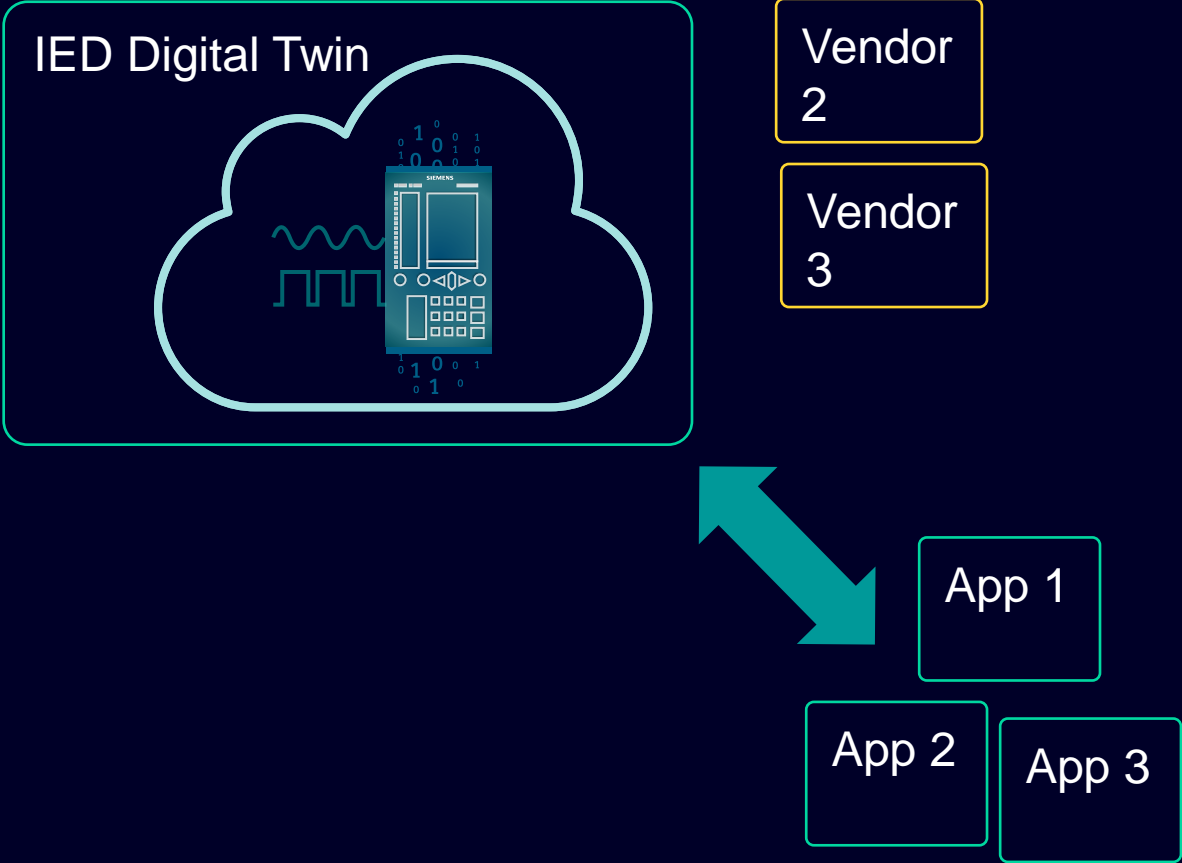

Be part of the pioneering journey

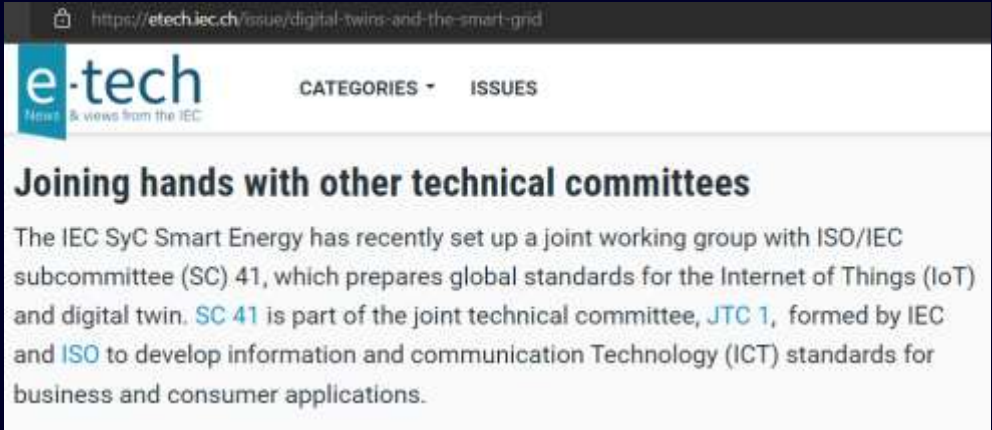

- Secure authentication
- File Exchange (e.g. COMTRADE)
- Communication exchange (e.g. GOOSE, SMV)
- Virtual Time and Time Synchronization between components
- ...

From manual interactions and assessments to open API Be part of the standardization journey

Standards to be shaped

Summary and Outlook

Digital Twins for Energy Automation

- A game changer in the power industry, for for protection and automation engineers involved in planning, engineering and operation of power grids
- Join the pioneering team and scale further the ecosystem of Digital Twin for Energy Automation!
- Ready to onboard? Start with a free trial
